

Measure Name	DAX Formula	Purpose
Total Sales	Total Sales = sum('Sample - Superstore'[Sales])	Used as a core KPI to measure overall business performance and as the baseline for calculating Profit Margin
Total Profit	Total Profit = sum('Sample - Superstore'[Profit])	Used as a core KPI and as the basis for Profit Margin
Total Orders	Total Orders = DISTINCTCOUNT('Sample - Superstore'[Order ID])	Used as a core KPI to track sales volume alongside revenue and profit
Profit Margin	Profit Margin = DIVIDE([Total Profit],[Total Sales],0)	Used to compare efficiency across Categories, Regions, and Segments — revealed that Furniture (2.7%) underperforms despite strong sales, and that Home Office (14%) is the most efficient segment
Average Discount	Average Discount = AVERAGE('Sample - Superstore'[Discount])	Used in the Discount Analysis to identify that Furniture carries the highest average discount (17%), linking discounting directly to its weak profit margin
Loss-Making Orders	Loss-Making Orders = COUNTROWS(FILTER(SUMMARIZE('Sample - Superstore','Sample - Superstore'[Order ID],"Order Profit", sum('Sample - Superstore'[Profit])), [Order Profit] < 0))	Used to identify and quantify the scale of loss-making activity across the business
Top 5 Loss-Making Products	Top 5 Loss Making Products = VAR Rankloss = RANKX(ALLSELECTED('Sample - Superstore'[Product Name]),CALCULATE(sum('Sample - Superstore'[Profit])),,ASC,Dense)RETURN if(Rankloss <= 5, CALCULATE(SUM('Sample - Superstore'[Profit])))	Easy way to know the top 5 products driving loss
