Executive Summary

This report presents a Business Intelligence analysis of the Superstore dataset, using Power BI to examine the company's sales and profitability performance. The analysis focused on overall sales performance, regional performance, customer segments, product categories, product profitability, and sales trends over time.

Findings

The analysis found that the company generated approximately \$2.30M in total sales, with the West region recording the highest sales and profit. The Consumer segment was the largest revenue contributor, generating approximately \$1.16M, while Technology was the leading product category with 36.4% of total sales. The analysis also identified the top five most profitable products and observed fluctuations in monthly sales, with stronger performance toward November and December.

Key Business Risks

- * Regional performance gap: Some regions generate significantly lower sales and profit than the West region.
- * Sales fluctuations: Monthly sales vary throughout the year, which may affect consistent business performance.
- * Product profitability concentration: A small group of products contributes strongly to overall profit, creating reliance on these products.

Key Business Opportunities

- * Regional growth: Successful strategies from the West region can be adapted to improve weaker regions.
- * Profitable product growth: The top five profitable products can be prioritized to increase sales and profitability.
- * Consumer segment growth: The Consumer segment's strong revenue contribution provides an opportunity to further increase sales through targeted strategies.
